## 1. Introduction

Market segment analysis is one of the critical step when assessing a new market for different products. However, to understand the economic growth and potential of a market segment requires decision making from existing data to understand potential customers' preferences and purchasing power. Through relevant data, a company can assess the internal and external factors which are critical for the success and growth of the business. This report is based on online survey about potential customer in Phoenix market as the company seeks to expand its tablet business into the area. The report highlights findings from data analysis to provide important information about the potential customers and how the company can leverage on some of the information to satisfy its customers.

Four statistical analysis procedures were used to extract useful information from the data set. First descriptive statistics were generated to understand the structure of the data and find important information to apply in inferential tests. The second test was independent sample t test and one way ANOVA to compare means among different variables in order to understand how different independent variables (IVs) affected different dependent variables (DVs). The third set of test was bivariate correlation which involved testing the trends and relationships among different variables to understand how such relationships can inform critical decision making when creating product lines for the Phoenix market customers. The last set of statistical test was linear regression which provided the association between DV and one or more IVs to help the business understand the effect of different variables of specific dependent variables of interest.

The company will be able to build their decision based on the findings of this report to appropriately serve the customers in Phoenix area by understanding their customers better.

## 1. Descriptive statistics

The following variables were selected for this analysis.

## VARIABLES:

income, sex, internet hours, petowner, weable, political, homo marry, religious, facebook, nextgen, companies, banks, science tech, USETECH, issues, degree, tvhours, careself, age, emailhrs, CINTV.

There were a total of 500 respondents. 499 provided their age where the mean age for the sample population was 52.27 , median of 50.00 , and mode 42.0 . The maximum and minimum age among the respondents was 102 and 9 respectively. Out of the 500 respondents, 274 were female while 226 were female representing $54.8 \%$ and $45.2 \%$ respectively. The maximum and minimum income was 383 and 250000 dollars respectively with min home income of 60752.71.

|  |  |  | Cumulative <br> Percent |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: |
| Valid | FEMAL | 274 | 54.8 | 54.8 | 54.8 |
|  | E |  |  |  |  |
|  | MALE | 226 | 45.2 | 45.2 | 100.0 |
|  | 500 | 100.0 | 100.0 |  |  |

Most of the respondents $40 \%$ were moderately religious followed by those without religious affiliation at $24.3 \%$. Table 2 shows the frequency of religious affiliation.

| R CONSIDER SELF A RELIGIOUS PERSON |  |  |  |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: |
|  |  | Frequency | Percent | Valid Percent | Cumulative <br> Percent |

Most of the respondents $35.6 \%$ spend more than 3 hour watching TV per day. With only a few spending less than 6 hours watching TV per day. The mean hours per day watching TV among the respondents was 3.32 and the mode was 2.87 . The mean email hours per week among the respondents was 3 hours, the mode was 4 , and median was 6.33 hours. The mean of hours spend on internet was 14.37 hours and mode of 18.0 hours. Mean percentage of time respondents used technology was $51.66 \%$ technology with most spending $50 \%$ of their time with technology. Most of the respondents had excellent and good ability to use the internet with only less than 100 having poor to very poor ability of using internet.

## R's ability to use internet

|  |  | Frequency | Percent | Valid Percent | Cumulative Percent |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Valid | Excellent | 125 | 25.0 | 25.0 | 25.0 |

## 2. Test of Difference

## Independent sample t-test 1: Statistical difference between means of female and male

 respondents on incomeIndependent sample t-test is one of the statistical procedures to compare the means of two independent groups to determine significance difference between them. This independent sample t -test tested the difference in means of home income between the two distributions. The following variables were used.

Dependent Variable: income

The null hypothesis for this test was that the distribution of income between male and female was significantly different.

T-TEST GROUPS=sex (1 2)
/MISSING=ANALYSIS
/VARIABLES=income
/CRITERIA=CI (.95) .

- T-Test

Group Statistics

|  | RESPONDENTS SEX | N | Mean | Std. Deviation | Std. Error <br> Mean |
| :--- | :--- | :--- | ---: | ---: | ---: |
| FAMILY INCOME IN <br> CONSTANT DOLLARS | FEMALE | MALE | 254 | 55004.83 | 48180.020 |

Independent Samples Test

According to the results, there were 254 female and 214 male respondents. The mean income for the female respondents was 55004.83 dollars while the mean income for male participants was 67574.95 dollars which is slightly higher than that for female. The standard deviations were also different. The results according to the p value $>.05$ suggests that there was significant difference in the means. However, further analysis of the sig value for two tailed test suggests that p value $<.05$ which corresponds to the F value suggests that there was no significant difference in the means of the two groups. However, results in the $95 \%$ confidence interval of the difference suggests that there are chances that the means could be significantly similar for the two distributions. Therefore, the null hypothesis was acceptable and the test was significant. Therefore, the final conclusion from the results is that sex of the customer does not affect home income.

## Independent sample t-test 2: Statistical difference between means of petowner respondents on internethrs

This $t$ test compared the mean difference in the hours spend on the internet between respondents who owned pets and those who did not with the assumption that the mean between the two groups was the same.

Independent variable: petowner

Dependent variable : internet_hrs

T-TEST GROUPS=petowner (1 2)
/MISSING=ANALYSIS
/VARIABLES=internet_hrs
/CRITERIA=CI (.95) .

- T-Test

Independent Samples Test

The results indicate that the mean internet hours of those who did not own a pet was slightly below those who owned a pet by 0.45 . However, the p value was $.83>.05$ which suggested that the variance in the means between the two groups was the same. Further analysis of the sig value with respect to the F statistic also confirms that the test was significant and that there was no significant difference between the means of internet hours for the two groups. The
results therefore, informs that owning or not owning a pet does not affect the hours one spends on the internet per week.

## One way ANOVA

## Test 1: Difference in means emailhr, HRS2, and USETECH by WEBABLE

One way ANOVA compares the means of dependent variables on groups of independent variable. Therefore, this one way ANOVA tested the difference in means of ability to use technology against percentage of time respondents use technology, email hours, and working hours per week.

IV: webable

DV: USETECH, emailhr, HRS2

```
ONEWAY emailhr HRS2 USETECH BY WEBABLE
```

    /MISSING ANALYSIS.
    - Oneway

The results suggested the test was significant $\mathrm{F}=.180,1.549,1.361$ for emailhrs, HRS2, and USETECH, $\mathrm{p}>.05$. The results suggests that there was no significant difference among the different groups based on their email hours per day, work hours per week, and percentage use of technology according to their ability to use technology. Therefore, one's ability to use technology does not determines their ability to use email, working hours per week, and percentage of time they will use the technology.

## Test 2: Difference in mean homo_marry, care_self by political

IV: political

DV: homo_marry and care_self

```
ONEWAY care_self homo_marry BY political
```

    /MISSING ANALYSIS.
    
## - Oneway

|  |  | ANOVA |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Sum of Squares | df | Mean Square | F | Sig. |
| THOSE IN NEED HAVE TO TAKE CARE OF THEMSELVES | Between Groups | 15.236 | 3 | 5.079 | 4.939 | . 002 |
|  | Within Groups | 334.187 | 325 | 1.028 |  |  |
|  | Total | 349.422 | 328 |  |  |  |
| HOMOSEXUALS SHOULD HAVE RIGHT TO MARRY | Between Groups | 67.986 | 3 | 22.662 | 11.088 | . 000 |
|  | Within Groups | 666.320 | 326 | 2.044 |  |  |
|  | Total | 734.306 | 329 |  |  |  |

The results suggested that the test was not significant $\mathrm{p}<.05$ for both groups. This implies that there was no significant difference in the means of people who advocated for homosexual marriage and attitude on self-care according to their political affiliation. Therefore, political
different opinions regarding self-care and homosexual marriage differ between different people based on their political affiliations.

## 3. Bivariate Correlations

## Correlation 1: relationship between religious, facebook, and nextgen

```
CORRELATIONS
    /VARIABLES=religious facebook nextgen
    /PRINT=TWOTAIL NOSIG
    /MISSING=PAIRWISE.
```

## - Correlations

| Correlations |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | R CONSIDER SELF A RELIGIOUS PERSON | About how often do you visit or use Facebook? | SCIENCE \& TECH. GIVE MORE OPPORTUNI TIES TO NEXT GENERATIO N |
| R CONSIDER SELF A RELIGIOUS PERSON | Pearson Correlation | 1 | -. 054 | . 099 |
|  | Sig. (2-tailed) |  | . 226 | . 115 |
|  | N | 497 | 497 | 253 |
| About how often do you visit or use Facebook? | Pearson Correlation | -. 054 | 1 | . $130{ }^{*}$ |
|  | Sig. (2-tailed) | . 226 |  | . 039 |
|  | N | 497 | 500 | 254 |
| SCIENCE \& TECH. GIVE MORE OPPORTUNITIES TO NEXT GENERATION | Pearson Correlation | . 099 | . $130{ }^{*}$ | 1 |
|  | Sig. (2-tailed) | . 115 | . 039 |  |
|  | N | 253 | 254 | 254 |

*. Correlation is significant at the 0.05 level ( 2 -tailed).

The results suggests that there significant negative correlation between those who considered themselves religious and frequency of visiting facebook ( $\mathrm{df}=496 \mathrm{r}=-.054, \mathrm{p}>.05$ ) but
strong positive correlation between religious and belief that technology would open opportunities for future generation ( $\mathrm{r}=.099, \mathrm{p}>.05$ ). There was no significant positive correlation between those who use facebook and the perception that technology will open more opportunity for future generation ( $\mathrm{df}=499, \mathrm{r}=.130, \mathrm{p}<.05$ ). Therefore, facebook use could not determine ability to embrace future technology but religion and attitude towards technology could.

Correlation 2: companies, banks, science_rsch

```
CORRELATIONS
    /VARIABLES=companies banks science_rsch
    /PRINT=TWOTAIL NOSIG
    /MISSING=PAIRWISE.
```

- Correlations

| Correlations |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | R CONFIDENC E IN MANOR COMPANIES | CONFID IN BANKS \& FINANCIAL INSTITUTION S | SCIRSCH IS NECESSARY AND SHOULD BE SUPPORTED BY FEDERAL GOVT |
| R CONFIDENCE IN MANOR COMPANIES | Pearson Correlation | 1 | . 364 "* | . 027 |
|  | Sig. (2-tailed) |  | . 000 | . 670 |
|  | N | 338 | 337 | 244 |
| CONFID IN BANKS \& FINANCIAL INSTITUTIONS | Pearson Correlation | . $3644^{\text {"* }}$ | 1 | $-.146^{*}$ |
|  | Sig. (2-tailed) | . 000 |  | . 021 |
|  | N | 337 | 342 | 247 |
| SCI RSCH IS NECESSARY AND SHOULDBE SUPPORTED BY FEDERAL GOVT | Pearson Correlation | . 027 | $-.146^{*}$ | 1 |
|  | Sig. (2-tailed) | . 670 | . 021 |  |
|  | N | 244 | 247 | 249 |

**. Correlation is significant at the 0.01 level ( 2 -tailed).
*. Correlation is significant at the 0.05 level ( 2 -tailed).

The results show no significant correlation between those with confidence in major companies and those with confidence in banks and financial institutions ( $\mathrm{df}=337, \mathrm{r}=.00$, $\mathrm{p}<.001$ ). There is significant positive correlation between confidence in major companies and support for science and technology by the government $(\mathrm{df}=243, \mathrm{r}=.027, \mathrm{p}>.05)$. No significant negative correlation between confidence in banks and support for science and technology from the federal government $(\mathrm{df}=246, \mathrm{r}=-.146, \mathrm{p}<.05)$. The results means that those supporting major companies and banks and financial institutions advocate for support from federal government towards science and technology.

## 4. Linear Regression

Linear Regression 1: Association bettween USETECH and income, issues, degree

IV: income, issues, degree

DV: USETECH (Only Continous DV variable in the dataset)

a. Dependent Variable: Percentage of time use tech

The results suggested that the three variables had significant potential to increase the percentage of time using technology $\left(\mathrm{R}^{2}=0.88, \mathrm{p}>.05, \mathrm{~F}=1.289\right)$. Each of the independent variable could result to $88 \%$ change in the percentage use of technology.

Linear Regression 2: Association between USETECH (only continuous variable for DV) and tvhours, CINTV, careself, age

|  | AGE OF RESPONDENT | -. 094 | . 097 | -. 054 | -. 963 | . 336 |

a. Dependent Variable: Percentage of time use tech

The results suggested that there was significant negative association between the four variables and percentage use of technology ( $\mathrm{p}>.05, \mathrm{R}^{2=}=.012, \mathrm{~F}=.980$ ). However, further analysis of Adjt $\mathrm{R}^{2}=.000$ suggests that there is no significant association.

## 5. Conclusion

Based on the analysis results of the dataset with 500 respondents, the first t test results suggested that the potential customers in Phoenix market have no variation in their house income according to sex. The second $t$ test suggested that there was no variation in the hours an individual would spend on the internet per week and the ability to own a pet. The first ANOVA test suggested that one's ability to use technology does not determines their ability to use email, working hours per week, and percentage of time they will use the technology. The second ANOVA test suggested that political different opinions regarding self-care and homosexual marriage differ between different people based on their political affiliations. First bivariate correlation showed that Facebook use could not determine ability to embrace future technology but religion and attitude towards technology could while the second revealed that those supporting major companies and banks and financial institutions advocate for support from federal government towards science and technology. The first linear regression analysis revealed that the percentage of time one uses technology can be predicted by their understanding of current issues, home income, and level of higher education. The last regression analysis revealed that attitude towards self-care, confidence in television, age, and hours spend on television.

Therefore, the company should consider source of income, level of education, and ability to use technology while building product lines and shaping their customer service to enhance improved customer relationship in Phoenix market.
